A small paper with a disputed flight model

WMT SDK demonstration | synthetic claims | not a research result

Model assumptions and a derived claim

All penguins are birds.

No penguins are fliers.

Tweety is a penguin.

Tweety is a bird.

The final sentence follows from the first and third sentences.

An existing bucket saying all birds are fliers conflicts with this model.

These statements exercise extraction, formalization and consistency checks.

The SDK preserves exact page offsets in the extracted text layer.

A checked entailment covers its formal target and listed premises only.

It is not evidence that natural-language extraction is complete or faithful.
